

DRYWALL

MAINTENANCE TIPS

- Variations in framing lumber widths, moisture content of finishing compounds and paint, along with gravity, may combine to cause “waves” or “dips” visible in drywall. This is considered normal installation.
- Hairline cracks in dry walled areas are a normal and natural occurrence in any home due to settlement (natural shrinkage and compression of materials) and climate variations.
- Ensure you are using the appropriate fasteners to attach mirrors, pictures or any decorative items to your drywall.

HOME CARE TIP

Drywall

Unusual abrasions may scuff or indent the surface of gypsum walls.

In that event, fill the indentation with two to three applications of spackling compound.
